# SECTION 12: ECOLOGICAL INFORMATION

	apply directly to water, to areas where surface water is present or to intertidal areas
	t contaminate water when cleaning equipment or disposing of equipment washwaters or
rinsate. The information presented be	low is on the technical active ingredient, glyphosate.
ECOTOXICITY DATA:	
Fish Acute and Prolonged Toxicity:	Bluegill Sunfish: >24 mg/L (48 hour)
	Rainbow Trout: 140 mg/L (48 hour)
Aquatic Invertebrate Acute Toxicity:	Daphnia magna: 780 ppm (48 hour)
Aquatic Plant Toxicity:	Not determined
Bird Acute and Prolonged Toxicity:	Bobwhite quail: Acute LD50 >2,000 mg/kg
Honeybee Toxicity:	>100 ug/bee (oral); practically non-toxic
ENVIRONMENTAL EFFECTS:	
Soil Absorption/Mobility:	Even though technical glyphosate is highly water soluble it appears that parent glyphosate and its degradation product, aminomethyl phosphonic acid (AMPA), have a low potential to move to ground-water due to their strong adsorptive characteristics demonstrated in laboratory and field studies. However, glyphosate does have the potential to contaminate surface waters due to its aquatic use patterns and erosion via transport of residues adsorbed to soil particles suspended in runoff water. If glyphosate were to reach surface water it would be resistant to hydrolysis and aqueous photolysis.
Persistence and degradability:	Glyphosate technical is readily degraded by soil microbes to aminomethyl phosphonic acid (AMPA), which is degraded to CO2, although at a slower rate than parent glyphosate.
Bioaccumulative Potential:	Not determined
Other adverse effects:	Not determined
